Characteristics of an Efficient Multi-Carrier Shipping Software

As ecommerce firms ramp up their efforts to satisfy customers' needs, shipping has become a core component of their business strategy.

A web-enabled user interface designed exclusively for eCommerce businesses, desktop shipping software is, hands-down, the most effective ways to streamline and automate the shipping process.

No matter type or size of business, successful order fulfillment matters. A successful order fulfillment process is the key to client satisfaction and increased sales. In short, companies need to make sure they are processing and fulfilling orders accurately, quickly and efficiently, without breaking the bank. One way to maximize returns and minimize costs is by implementing multi-carrier shipping software.

here's everything you need to know about the main features of a multi-carrier shipping platform

Centralized Solutions

First off, multi-carrier software is designed to support multiple carriers. As a result, the shipping solution enables users to access different carriers in designated areas.

If you're catering to diverse markets or international customers, multi-carrier software can help you deliver a seamless delivery experience. Seamless and smooth shipping contributes to customer satisfaction and brand loyalty. The software combines the expertise of local and international shipping carriers and allows businesses to ship their products to as many countries as possible.

Cost reduction

Controlling shipping costs is crucial for any business owner. Besides the fact that carriers update their rates frequently, factors like bad weather, incorrect customer address and more, can surge the cost of your shipping and deliveries.

A multi-carrier shipping software can help keep shipping costs under control. This is because the software allows business owners to compare rates offered by multiple carriers. You can select carriers offering shipping at competitive rates.

Evaluate carrier reputation

With so many carrier options, how can you separate the good from the bad? Multi-carrier software makes it really easy to check and compare the performance of multiple carriers.

Promotes efficiency

Last but not least, users can track the progress of their deliveries via multi-carrier software. From the time a package is dispatched until the time it reaches a customer, a lot can happen. In order to monitor the status and condition of shipments, use multi-carrier software for your business.

In a nutshell, multi-carrier can make shipping simpler, faster and better for ecommerce businesses.

Ready to integrate multi-carrier shipping into your company? ProcessWeaver offers user-friendly multi-carrier shipping products for organizations, including B2B and B2C. Their shipping software supports a wide range of carriers, including FedEx, DHL, UPS, TNT and more. Moreover, the software ensures seamless integration with SAP, Oracle, Sage and other ERP systems.
